

Architecture:

How to run:

- Can be run directly as docker container from visual studio
- Run the containers:
 1. Go to the root folder of each project (where the Dockerfile is present)
 2. Cmd: `docker build -t spa . && docker run -p 5000:5000 spa` (run the SPA)
 3. Cmd: `docker build -t api . && docker run -p 5001:5001 api` (run the API)

Short Description:

The product is present as a build of **Hahn.ApplicationProcess.July2021.Web** as the API, and the SPA is present in the **Hahn.ApplicationProcess.July2021.SPA** project.

The development of the SPA is done on a Nodejs application and later bundled by the webpack and added to the wwwroot of the project talked about above.
